

Linux Socket Programming by Example

Table of Contents

Preface>

I: Basic Socket Concepts

1. Introducing Sockets

2. Domains and Address Families

3. Address Conversion Functions

4. Socket Types and Protocols

5. Binding Addresses to a Socket

6. Connectionless-Oriented Protocols

7. Connection-Oriented Protocols for Clients

8. Connection-Oriented Protocols for Servers

9. Hostname and Network Name Lookups

II: Advanced Socket Programming

10. Using Standard I/O on Sockets

11. Concurrent Client Servers

12. Socket Options

13. Broadcasting with UDP

14. Out-of-Band Data

15. Using the inetd Daemon

16. Network Security Programming

17. Passing Credentials and File Descriptors

18. A Practical Network Project

Appendixes

A. Socket Function Quick Reference

B. Socket-Related Structures Reference

C. Useful Network Tables

Introduction

The by Example Series

Who Should Use This Book

Conventions Used in This Book

Where to Find the Code

What's Next

I: Basic Socket Concepts

1. Introducing Sockets

A Brief Historical Introduction

Understanding Sockets

Comparing Sockets to Pipes

Creating Sockets

Performing I/O on Sockets

Closing Sockets

Writing a Client/Server Example

2. Domains and Address Families

Nameless Sockets

Understanding Domains

Forming Socket Addresses

Forming Local Addresses

Forming Internet (IPv4) Socket Addresses

Specifying an X.25 Address

Specifying Other Address Families

The AF_UNSPEC Address Family

3. Address Conversion Functions

Internet IP Numbers

Allocating IP Addresses

Manipulating IP Numbers

4. Socket Types and Protocols

Specifying the Domain of a Socket

Using the socket(2) Function

Choosing a Socket Type

Choosing a Protocol

Socket Domain and Type Summary

Other Linux-Supported Protocols

5. Binding Addresses to a Socket

The Purpose of the bind(2) Function

Using the bind(2) Function

Obtaining the Socket Address

Interfaces and Addressing

6. Connectionless-Oriented Protocols

The Methods of Communication

Performing Input/Output of Datagrams

Writing a UDP Datagram Server

Writing a UDP Datagram Client

Testing the Datagram Client and Server

7. Connection-Oriented Protocols for Clients

Reviewing the Methods of Communication

Internet Services

Consulting the /etc/protocols File

Writing a TCP/IP Client Program

Using connect(2) on SOCK_DGRAM Sockets

What's Next

8. Connection-Oriented Protocols for Servers

Understanding the Role of the Server

The listen(2) Function

The accept(2) Function Call

Writing a TCP/IP Server

Modifying the Client Program

9. Hostname and Network Name Lookups

Understanding the Need for Names

Using the uname(2) Function

Obtaining Hostnames and Domain Names

Resolving Remote Addresses

II: Advanced Socket Programming

10. Using Standard I/O on Sockets

Understanding the Need for Standard I/O

Associating a Socket with a Stream

Closing a Socket Stream

Using Separate Read and Write Streams

Winding Up Communications

Handling Interrupts

Defining Buffer Operation

Applying FILE Streams to Sockets

What's Next

11. Concurrent Client Servers

Understanding the Multiple-Client Problem

Overview of Server Functions

Using fork(2) to Service Multiple Clients

Designing Servers That Use select(2)

Applying select(2) to a Server

What's Next

12. Socket Options

Getting Socket Options

Setting Socket Options

Retrieving the Socket Type (SO_TYPE)

Setting the SO_REUSEADDR Option

Setting the SO_LINGER Option

Setting the SO_KEEPAIVE Option

Setting the SO_BROADCAST Option

Setting the SO_OOBINLINE Option

Options SO_PASSCRED and SO_PEERCRE

What's Next

13. Broadcasting with UDP

Understanding Broadcast Addresses

Broadcasting from a Server

Receiving Broadcasts

Demonstrating the Broadcasts

Broadcasting to a Network

What's Next

14. Out-of-Band Data

Defining Out-of-Band

Understanding the Need for Out-of-Band Data

Sockets and Out-of-Band Data

Variations in Implementation

Using Out-of-Band Data

Understanding the Urgent Pointer

Receiving Out-of-Band Data Inline

Limitations of the Urgent Mode Pointer

What's Next

15. Using the inetd Daemon

Steps Common to Most Servers

Introducing inetd

Implementing a Simple stream tcp Server

Datagram Servers with inetd

What's Next

16. Network Security Programming

Defining Security

The Challenges of Security

Identifying Friend or Foe

Securing inetd Servers

Installing Wrapper and Server Programs

Introducing the Client Program

Installing and Testing the Wrapper

What's Next

17. Passing Credentials and File Descriptors

Problem Statement

Introducing Ancillary Data

Introducing I/O Vectors

The sendmsg(2) and recvmsg(2) Functions

Ancillary Data Structures and Macros

Presenting an Ancillary Data Example

Testing the Socket Server

What's Next

18. A Practical Network Project

Problem Statement

Solving the Quote Service Problem

Examining the Quote Server Program

Fetching Quotations via get_tickinfo()

Broadcasting Quotes via broadcast()

Examining the Client Program

Compiling and Running the Demonstration

What's Next

Appendixes

A. Socket Function Quick Reference

Socket-Specific Functions

Socket Addressing

Reading of Sockets

Writing to Sockets

Other Socket I/O

Controlling Sockets

Network Support Functions

Standard I/O Support

Hostname Support

B. Socket-Related Structures Reference

Socket Address Structures

Miscellaneous Structures

I/O-Related Structures

C. Useful Network Tables

glossary
